TARGET USERS

RETAIL OWNERS

Retail Owners who need to decide, with limited budget and shelf space, what to reorder products or items in each cycle.

STORE STAFF

Store Staff are responsible for day-to-day restocking decisions, often without direct sales data.

Problem Statement

1

Staff dont have a clear, on going view of which items sells fast.

2

Restocking could and can be a guesswork or “what’s look low” instead of based on sales performance.

3

Because of this, when popular items runs out it lost sales. While the slow-moving get restocked unnecessarily.

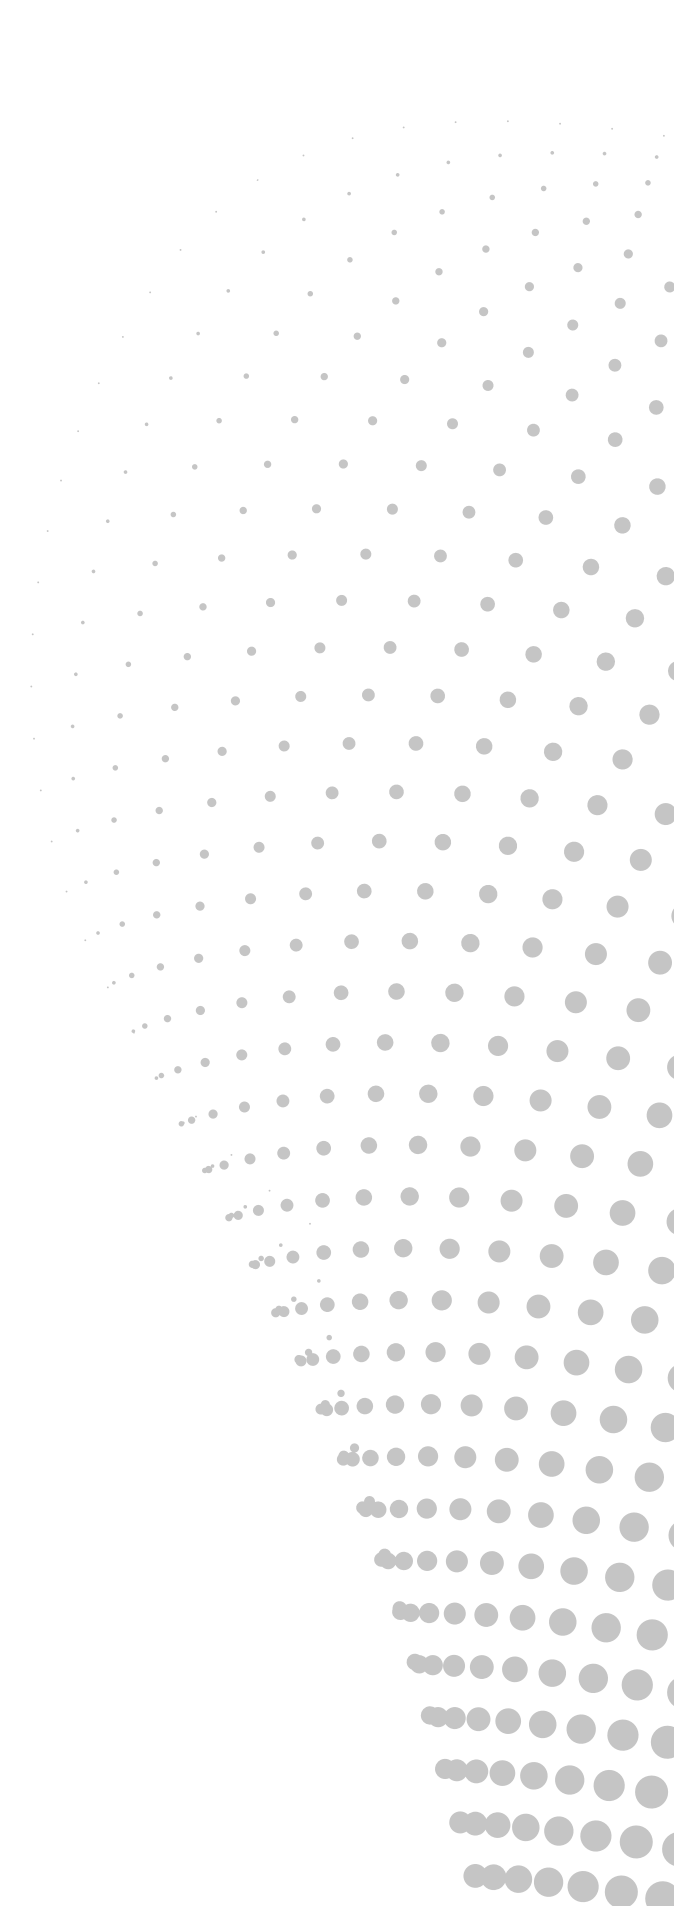

CURRENT PROCESS

KEY PAIN POINTS

- Sales aren't tracked in a way that shows which items sold fastest.
- Staffs decide what to reorder from memory, not from actual sales performance.
- There's no ranking or comparison between items that sold fastest. Thus, has no guide prioritization when budget/space is limited.

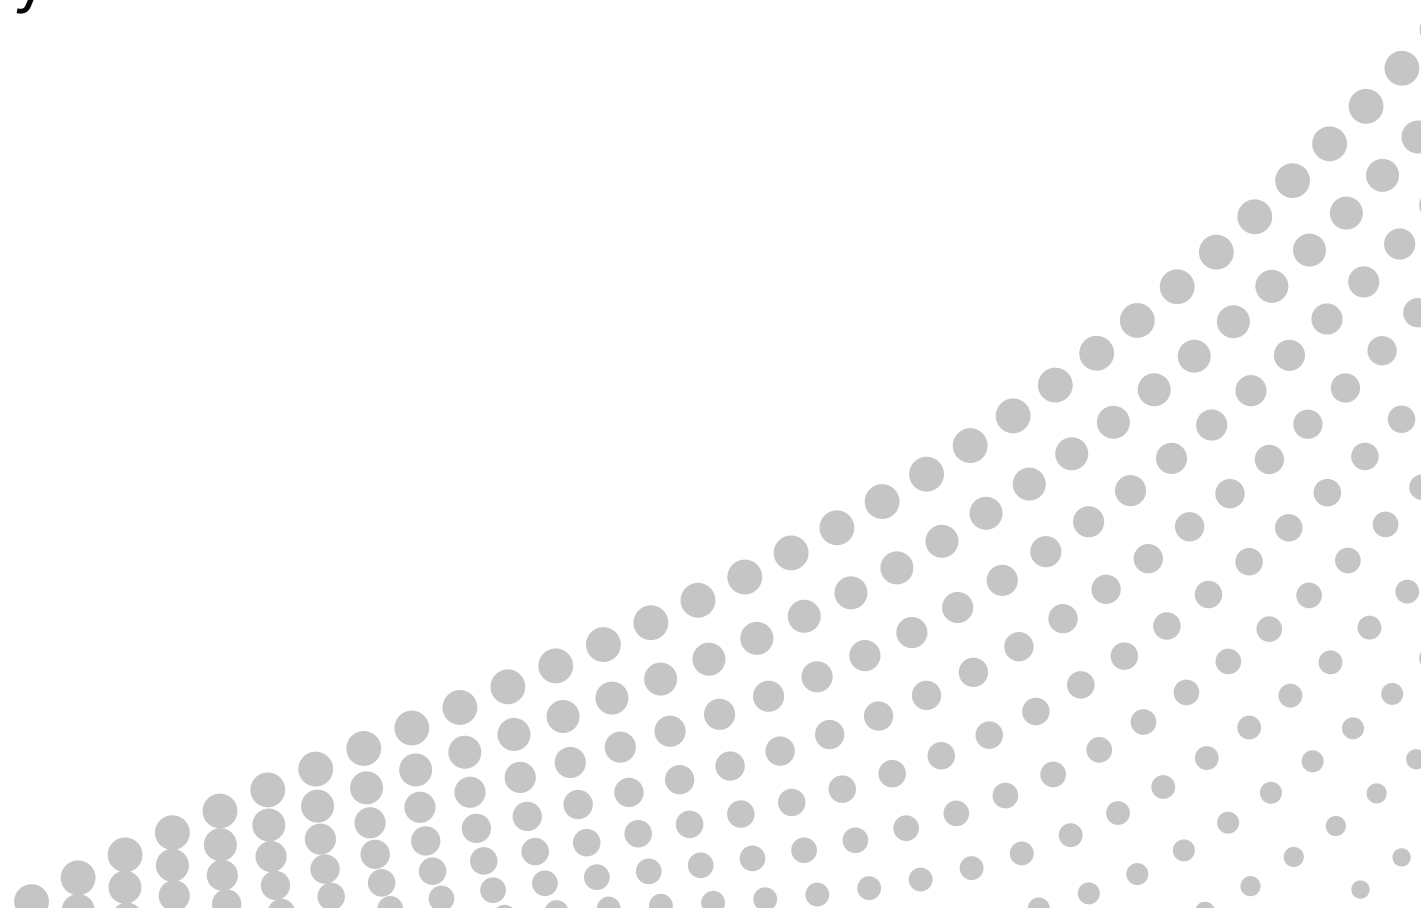

DELAYS THIS CAUSE:

- Fast-sellers are only noticed as "out of stock" after customers start asking or leaving
- Restocking meetings take longer, since staff have to guess or manually tally receipts to figure out what actually sold.

CURRENT PROCESS

ERROR THIS CAUSES

- Overstocking slow movers — money tied up in items that barely sell, sitting on shelves (or spoiling, if perishable)
 - Understocking fast movers — best-selling items run out repeatedly, leading to direct lost sales ("over loss" — the store loses revenue it could have earned)
 - No objective basis for reorder decisions, so mistakes repeat every cycle
- 

PROPOSED SOLUTION

1

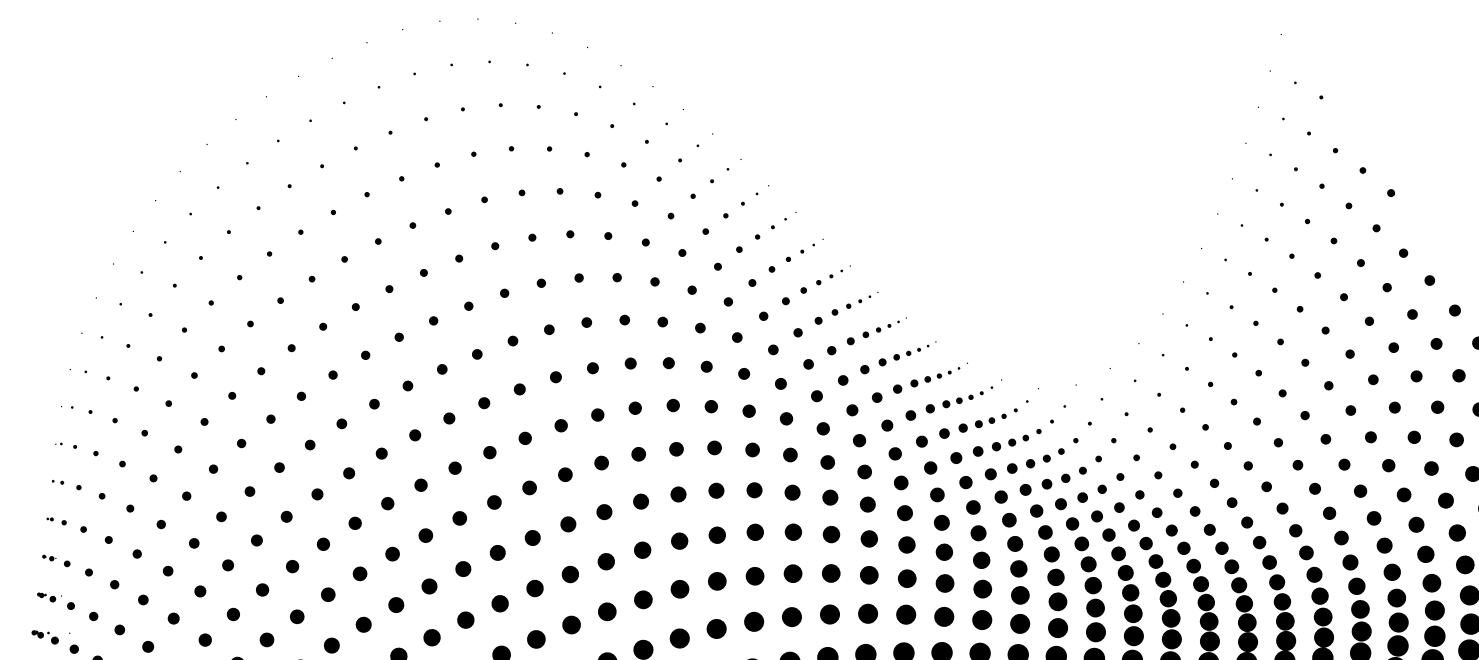

Every sales is entered thru
Light Weight Point of Sales
It selects the item(s) sold
and it's quantity.

2

Each completed sales it
automatically logs the
unit/item sold and updates
stock on hand in real time.

3

The system then tallies the
sales over a given period.
Then it ranks the items
solds fastest to least.
Giving the staff a clear,
data-backed lists.

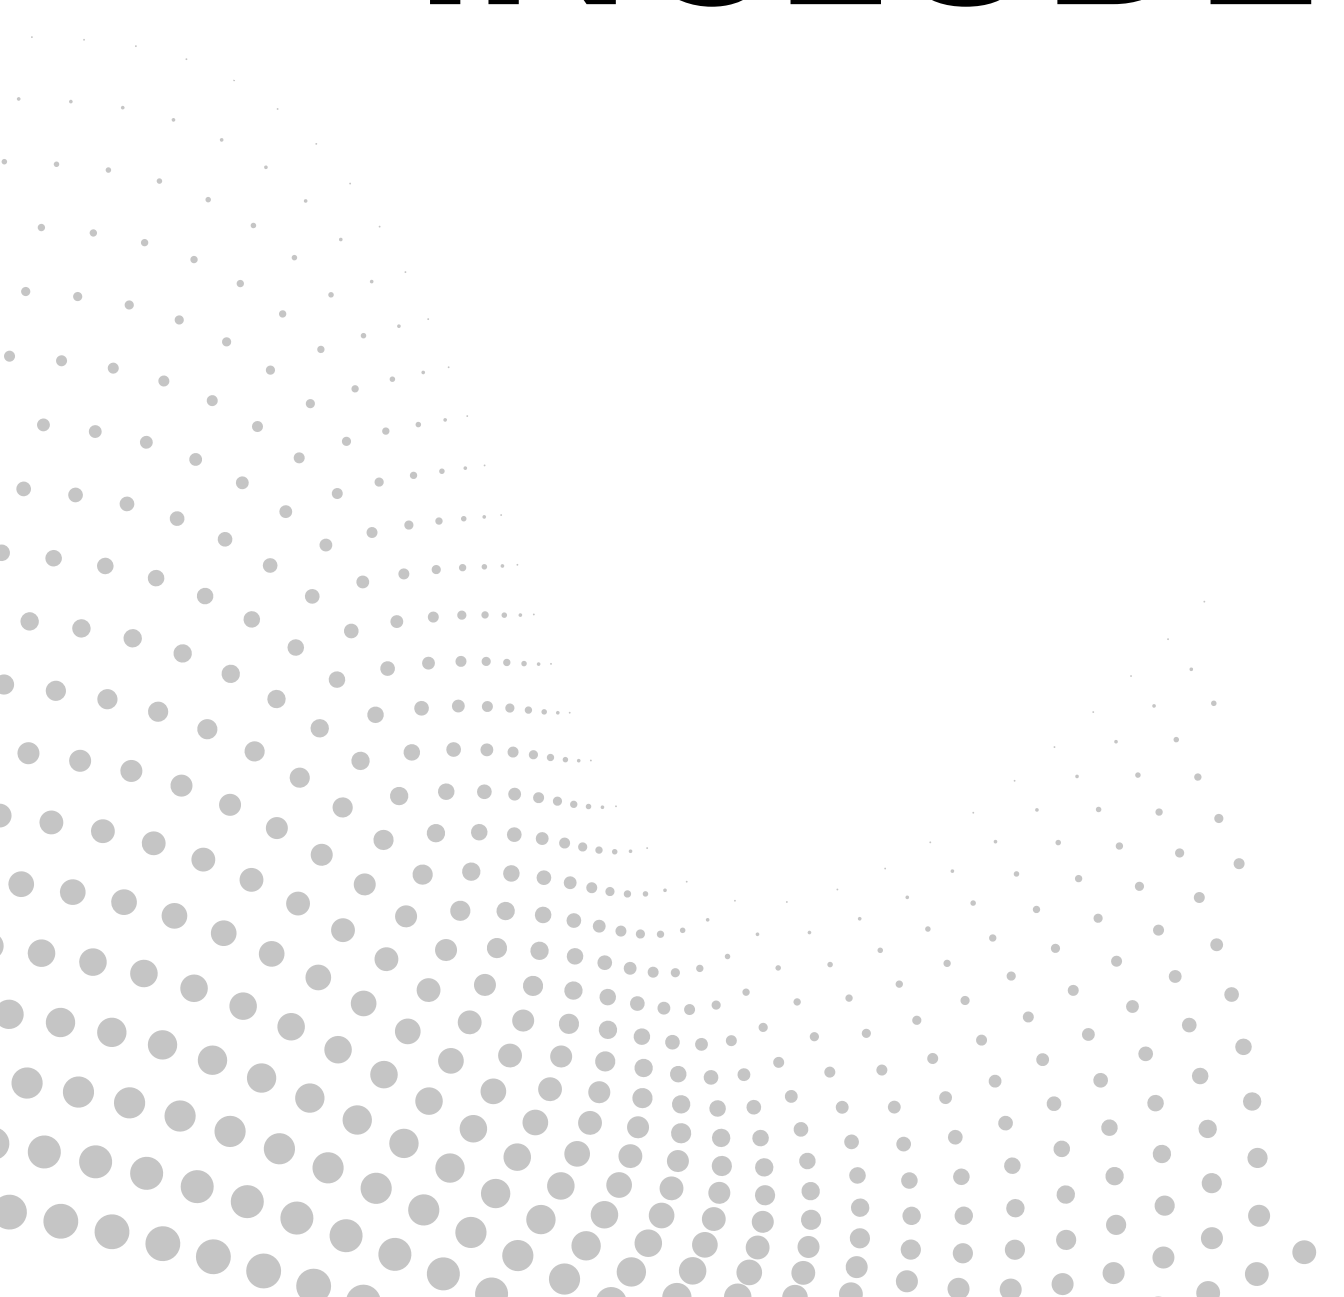

THREE CORE FEATURES

1. A system that tallies real sales data over a period and ranks items from most to least purchased.

2. POS-style sale entry — staff select item(s) + quantity when a sale happens

3. Real-time stock updates — each sale automatically updates stock-on-hand, no end-of-day tallying

SCOPE AND LIMITATION: INCLUDES

Item Stock and Sales Log — name, quantity, price, units sold.

Sales-Ranking Calculator — tallies and ranks items by units sold over a period.

Reorder Priority Dashboard — visual best-to-worst seller list with low-stock flags.

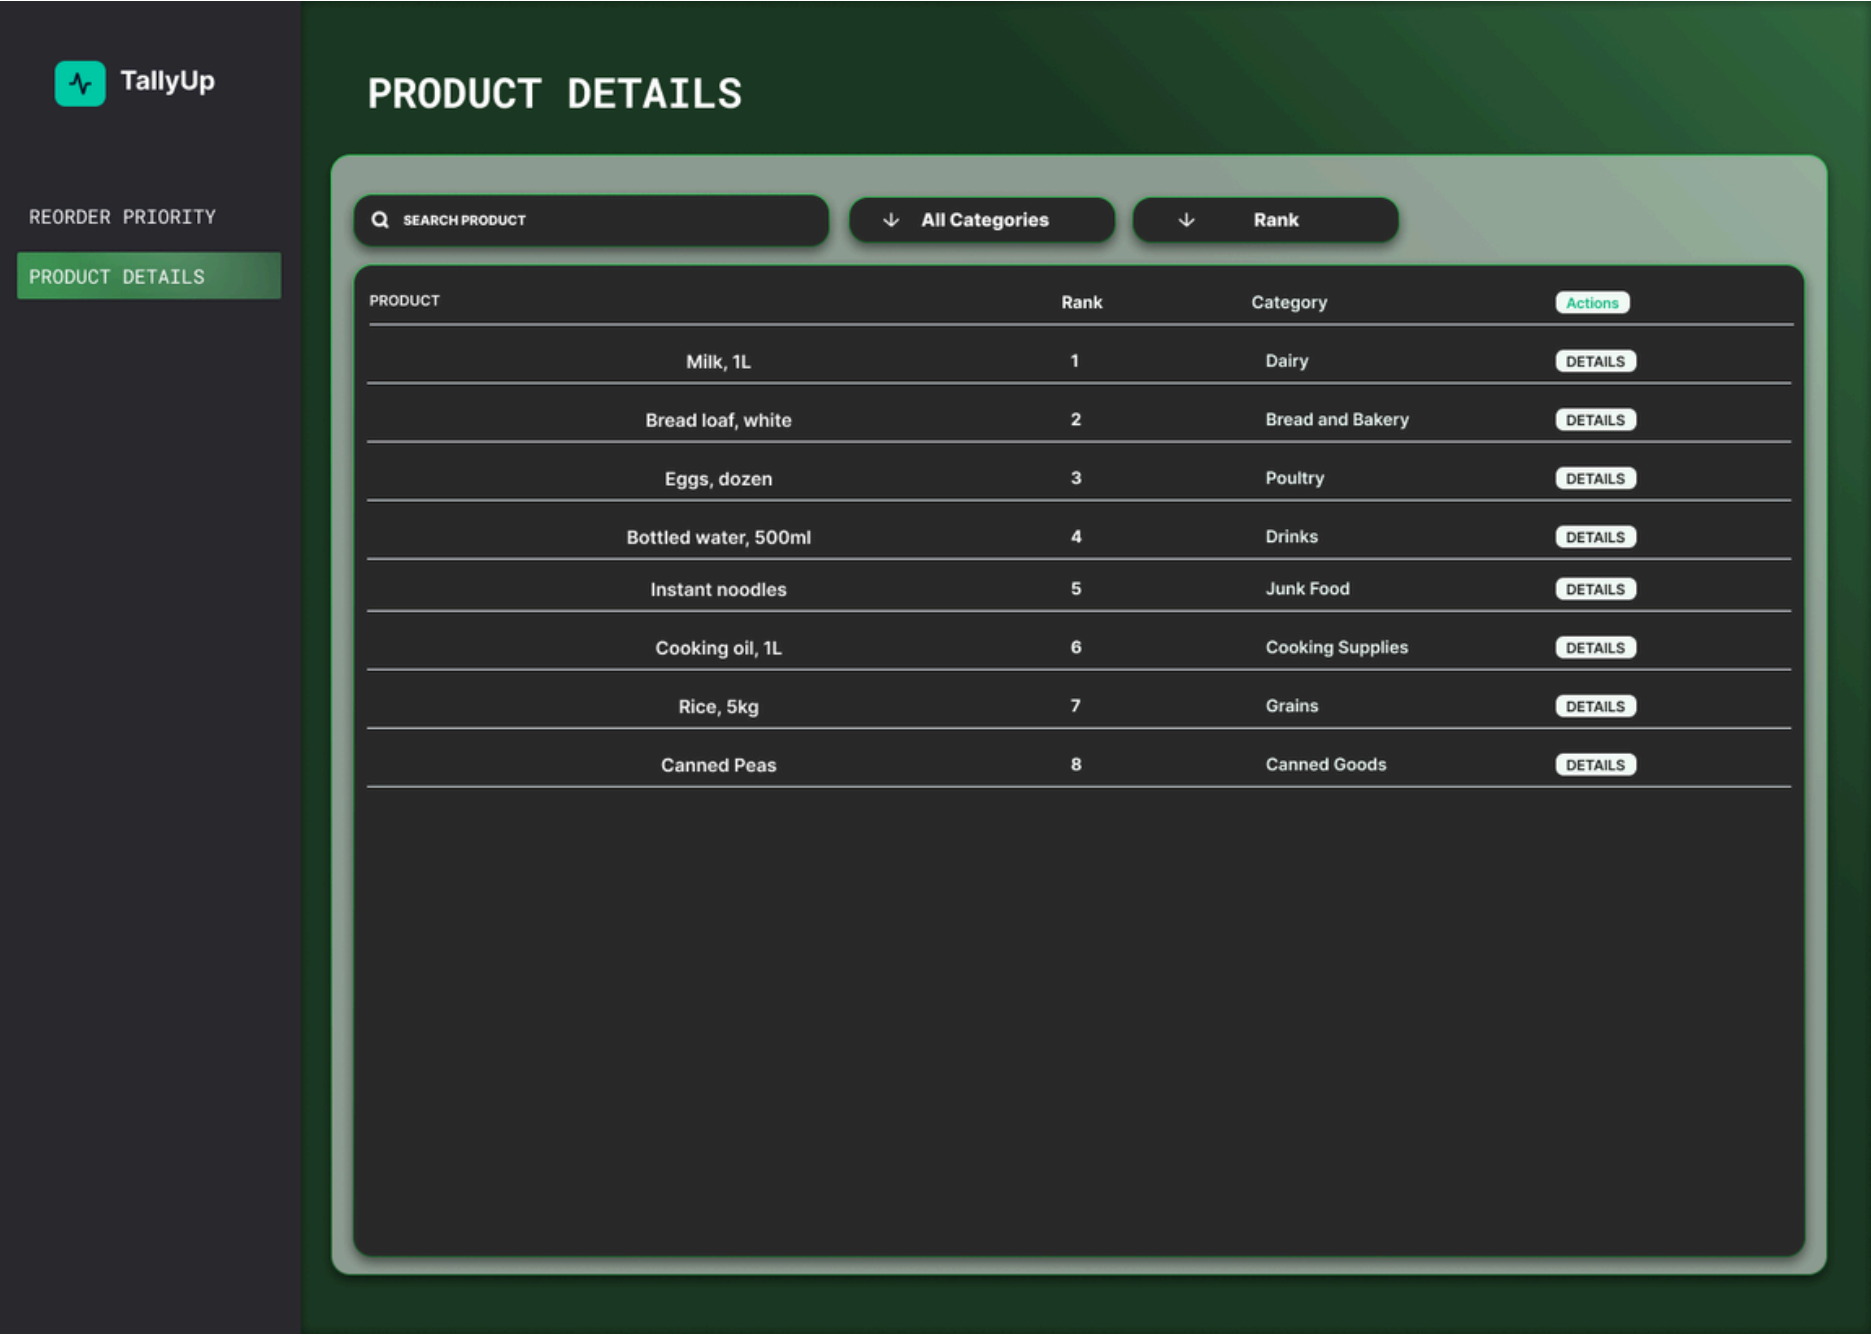

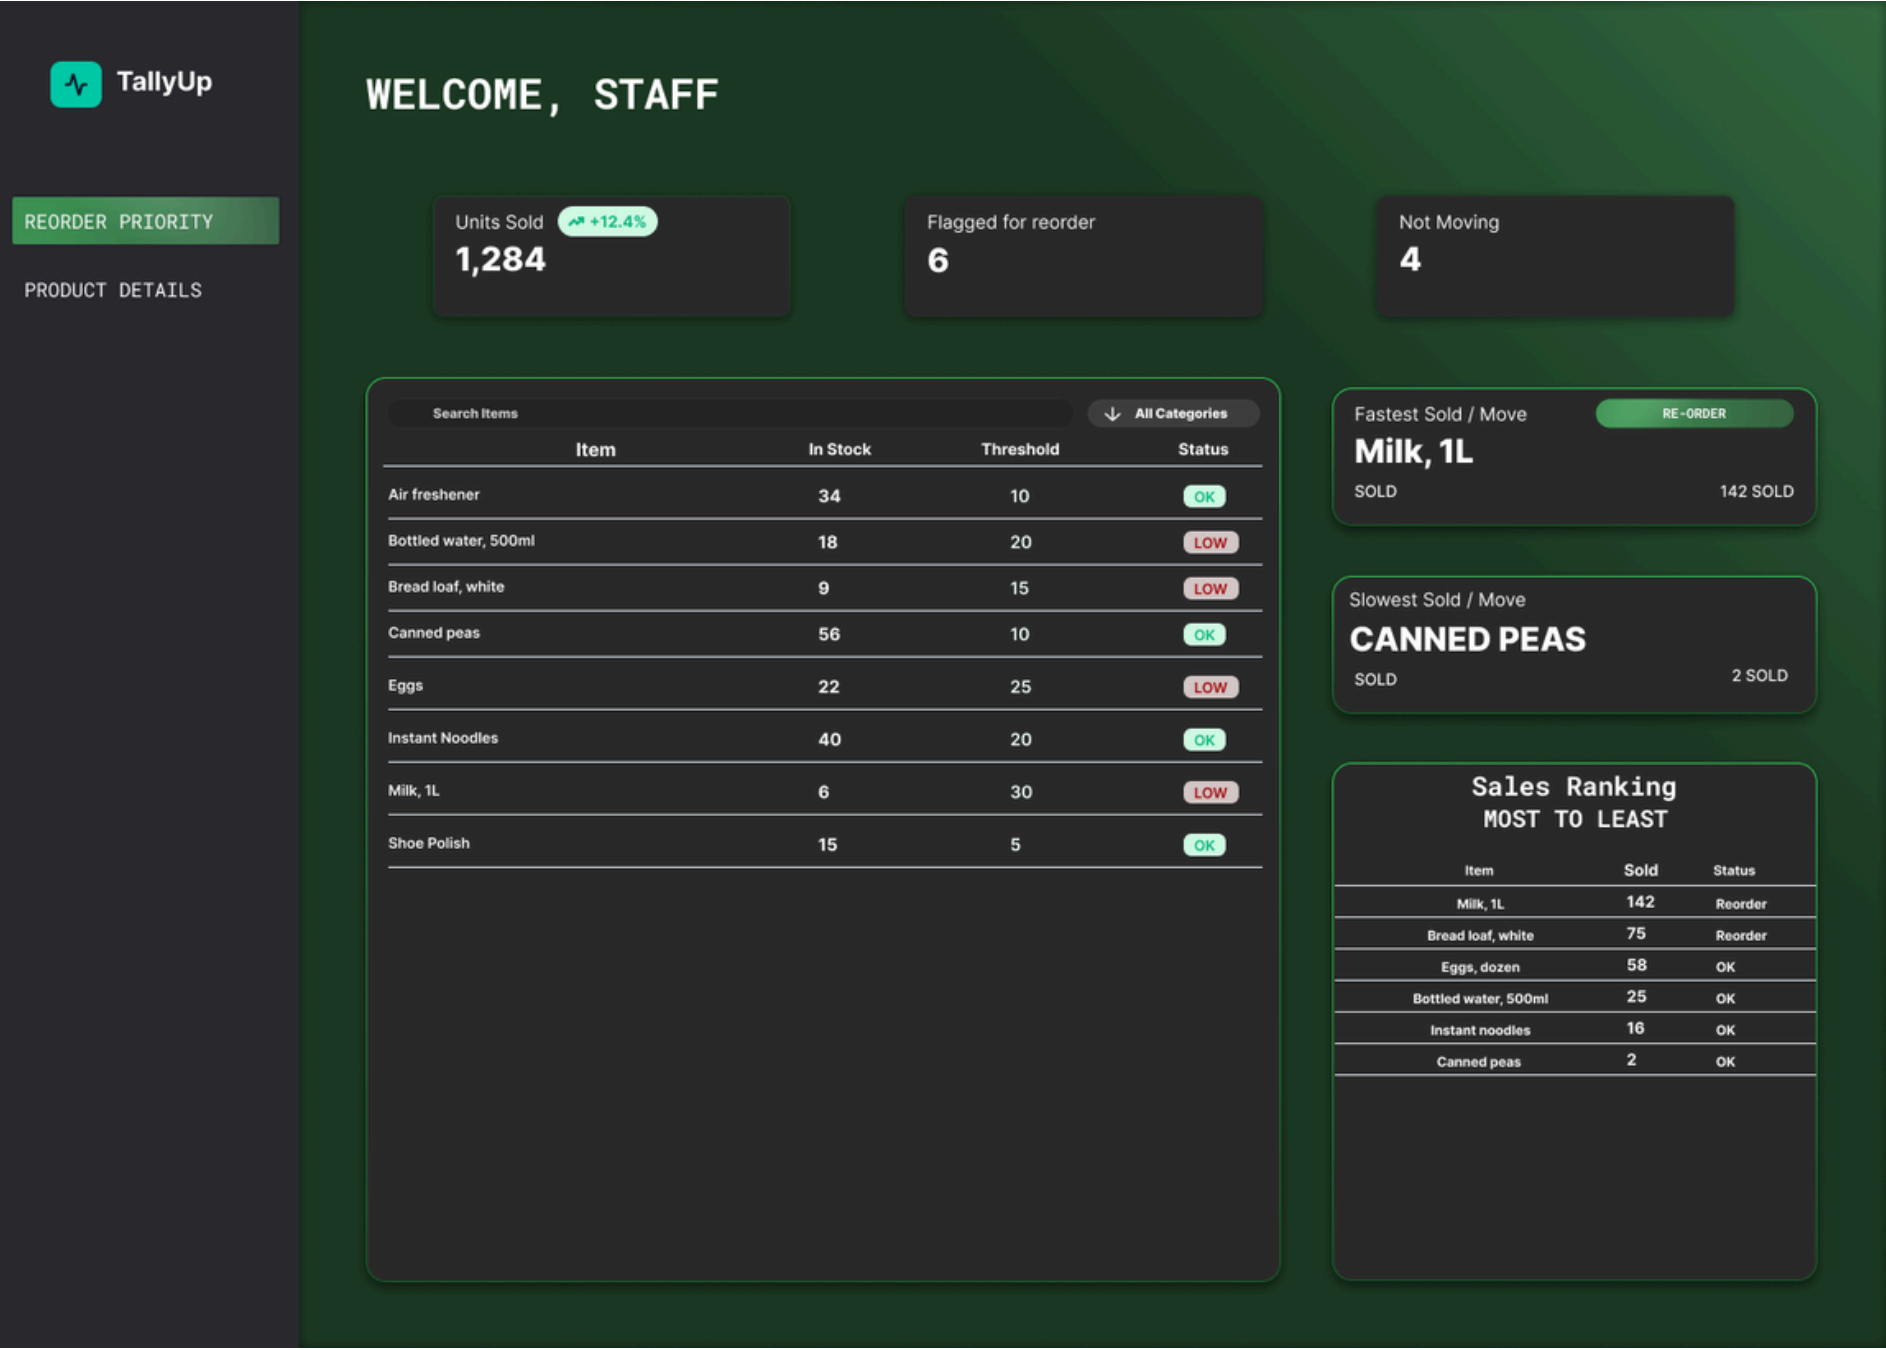

SCOPE AND LIMITATION: EXCLUDES

Supplier ordering/procurement
automation

Discounting/promotion execution
(system only flags — it doesn't apply
discounts)

No Multi - Branch Comparison, and Full
Accounting/Financial Reports.
